

CLAIM AMENDMENTS:

This listing of claims will replace all prior versions, and listings, of claims in the application:

1. (Currently Amended) A method of providing a distinctive call waiting tone based on a redirecting number, the method comprising:

receiving a call from an originating device at a redirecting device;

forwarding the call from the redirecting device to a destination device, the forwarded call

having an associated data message that includes a calling number of the originating device, a called number of the destination device, and a redirecting number of the redirecting device;

comparing, at a controller communicatively coupled to the destination device, the redirecting number to an authorized set of numbers;

when the authorized set of numbers includes the redirecting number and the destination device is in use, applying a call waiting tone of a plurality of distinctive types of call waiting tones to the destination device, wherein the call waiting tone is based on upon the redirecting number when the destination device is in use; and

when the authorized set of numbers includes the redirecting number and the destination device is not in use, applying a ring tone one of a plurality of distinctive ring tones to the destination device, wherein the ring tone is determined based on upon the redirecting number when the destination device is not in use.

2. (Currently Amended) The method of claim 1, further comprising: ~~applying a normal call waiting tone to the destination device for a second inbound call received by the destination device without call forwarding~~

receiving a second call at the destination device, wherein the second call is not forwarded; and

applying a normal call waiting tone to the destination device.

3. (Cancelled).

4. (Currently Amended) The method of claim 1, wherein the associated data message is compatible with ~~[[an]]~~ a Signaling System 7 (SS7) ~~[[SS7]]~~ compatible network.

5. (Currently Amended) The method of claim 1, wherein the method is implemented in a Voice over Internet Protocol (VoIP) ~~VoIP~~ type system using a soft switch.

6. (Original) The method of claim 1, wherein the method is implemented in a PBX type system.

7. (Currently Amended) A method of processing an intelligent network communication, the method comprising:

receiving a query message including inbound call data at a ~~switch control point controller~~
communicatively coupled to a destination device;

determining that the inbound call data includes a redirecting number;

determining a usage status of ~~[[a]]~~ the destination device;

comparing, at the controller, the redirecting number to an authorized set of numbers;

when the authorized set of numbers includes the redirecting number and the destination device is in use, formulating a response message to the query message, wherein the response message identifies a call waiting tone of a plurality of call waiting tones to use on a subscriber line and wherein the call waiting tone is determined based on the redirecting number;

when the authorized set of numbers includes the redirecting number and the destination device is not in use, formulating the response message to the query message, wherein the response message identifies a ring tone of a plurality of ring tones to use on a subscriber line and wherein the ring tone is determined based on the redirecting number; and

~~formulating a response message to the query message, the response message identifying a tone, wherein the tone is a call waiting tone of a plurality of distinctive types of call waiting tones to use on a subscriber line based on the redirecting number when the destination device is in use, and wherein the tone is a ring tone of a plurality of distinctive ring tones to use on the subscriber line based on the redirecting number when the destination device is not in use;~~

sending the response message as a reply to the query message, to a service switching point;

~~applying at a switching control point the tone after receiving the response message from the switch control point.~~

8.- 9. (Cancelled).

10. (Currently Amended) The method of claim 7, wherein the switch control point is Signaling System 7 (SS7) SS7 compatible.

11. (Currently Amended) A method of processing a communication, the method comprising:

receiving a call request message including inbound call data;

~~determining that the inbound call data includes a redirecting number;~~

sending the call request message to a controller communicatively coupled to a destination device;

receiving a response message from the controller, wherein the response message indicates that the call request message includes a redirecting number that is in an authorized set of numbers;

when the destination device is in use, setting [[one]] a call waiting tone of a plurality of distinctive types of call waiting tones on a subscriber line, wherein the call waiting tone is determined based on the redirecting number when a destination device is in use; and

when the destination device is not in use, setting [[one]] a ring tone of a plurality of distinctive types of ring tones on the subscriber line, wherein the ring tone is determined based on the redirecting number when the destination device is not in use.

12. (Currently Amended) The method of claim 11, further comprising: ~~applying a normal call waiting tone to a second call notification for a second inbound call received without the redirecting number~~

receiving a second call request message including second inbound call data; and

setting a normal call waiting tone on the subscriber line when the second inbound call data does not include a second redirecting number.

13. (Cancelled).

14. (Currently Amended) The method of claim 11, wherein the method is implemented on [[an]] a Signaling System 7 (SS7) [[SS7]] compatible network.

15. (Currently Amended) The method of claim 11, wherein the method is implemented in a Voice over Internet Protocol (VoIP) VoIP type system using a soft switch.

16. (Original) The method of claim 11, wherein the method is implemented in a PBX type system.

17. (Currently Amended) An intelligent network system comprising:

a switching control point; and

a service switching point coupled to the switching control point;

wherein the service switching point is configured to send send a request message to the switching control point, the request message including a subscriber telephone number, a redirecting number, and a destination number; [[and]]

wherein the switching control point is configured to send send a response message to the service switching point; [[,]]

wherein when the destination device is in use, the response message including an identifier of a tone to apply to a destination device associated with the destination number, wherein the tone is identifies a call waiting tone of a plurality of distinctive types of call waiting tones to apply to a destination device associated with the destination number, wherein the call waiting tone is determined based on the redirecting number; when the switching control point determines the destination device is in use, and

wherein when the destination device is not in use, the response message identifies the tone is a ring tone of a plurality of ring tones to apply to the destination device associated with the destination number, wherein the ring tone is determined based on the redirecting number when the switching control point determines the destination device is not in use.

18. (Previously Presented) The system of claim 17, wherein the service switching point is coupled to the destination device.

19. (Previously Presented) The system of claim 18, wherein the service switching point applies the tone to the destination device.

20. (Original) The system of claim 17, wherein the service switching point receives a call prior to sending the request message to the switching control point.

21. (Currently Amended) The system of claim 17, wherein the service switching point and the switching control point are Signaling System 7 (SS7) SS7 compatible.

22. (Currently Amended) A system comprising:

a call facilitating module; and

a call logic module coupled to the call facilitating module;

wherein the call facilitating module is configured to send sends a request message to the

call logic module, the request message including a subscriber telephone number, a

redirecting number, and a destination number; [[and]]

wherein the call logic module is configured to send sends a response message to the call

facilitating module; [[,]]

wherein when the destination device is in use, the response message including an

identifier of a tone to apply to a destination device associated with the destination

number, wherein the tone is identifies a call waiting tone of a plurality of

distinctive types of call waiting tones to apply to a destination device associated

with the destination number, wherein the call waiting tone is determined based on

the redirecting number; when the destination device is in use, and

wherein when the destination device is not in use, the response message identifies the

tone is a ring tone of a plurality of ring tones to apply to the destination device

associated with the destination number, wherein the ring tone is determined based

on the redirecting number when the destination device is not in use.

23. (Currently Amended) The system of claim 22, wherein the call facilitating module is configured to communicate ~~communication~~ with the destination device.

24. (Previously Presented) The system of claim 23, wherein the call facilitating module applies the tone to the destination device.

25. (Currently Amended) The system of claim 22, wherein the call facilitating module receives a call message prior to sending the request message to the call logic module ~~switching control point~~.

26. (New) The method of claim 7, wherein the controller is a switch control point.

27. (New) The method of claim 7, further comprising applying at least one of the call waiting tone and the ring tone to the destination device in response to the response message.
